

WordPress Developer | Elite Techcon | Ahmedabad

Manage Front-End Development: WordPress developers design and build the front end of WordPress websites, which is what the user sees and interacts with. They design website layouts and add content, often using languages like HTML and CSS. Some front-end WordPress developers study how people use the website so they can make changes to the user experience and make the site more visually appealing and user-friendly.

Manage Back-End Development: Back-end development is work that WordPress developers do on the server-side, which controls how the site works and encompasses changes and updates. Back-end work involves databases and servers, and developers work on features like structure, security, and content management. They write code in languages like PHP or .NET, which are compatible with databases.

Generate Plug-Ins and Themes: WordPress utilizes themes and plug-ins, and WordPress developers work with code to create them. Themes manage the display and layout of a page and are usually available for purchase to WordPress users. Plug-ins are add-ons that add functionality and elements to WordPress pages.

Performance Monitoring: WordPress developers spend time monitoring WordPress web applications to make sure they are online, working correctly, and loading quickly. They respond to error codes and troubleshoot problems.

Participate in Team and Client Meetings: Depending on their work venue, WordPress developers attend agency meetings or meet with clients. Some developers focus on working with clients to conceptualize their ideas to help bring the client's vision into reality.

Conduct WordPress Client Training: After a developer creates a WordPress site for a client, they often train the client on how to use WordPress to manipulate the site, add content, and whatever else the client needs to know to make the most of their site.
